

IMAX® PICTURE: SO REAL YOU'LL FORGET IT'S A MOVIE

IMAX®'s state-of-the-art projection systems deliver lifelike, crystal-clear images to create a visual experience so real you'll forget you're watching a movie.

Picture Perfect:

You're not the only one watching the movie. IMAX's projection systems feature a proprietary built-in remote sensor that monitor the screen as if it were the audience's eyes and make real-time adjustments to ensure the system is always delivering the best possible image.

A Truly Customized Experience:

IMAX designs every IMAX® projection system and screen for each individual theatre. In fact, IMAX engineers spend nearly a year to custom-design and develop each projector lens.

Mind-Blowing Images:

In an IMAX® theatre, it's like you're watching a different movie. Combining IMAX's Digital Re-mastering (DMR®) enhancement process, which enhances hundreds of details in virtually every frame of the movie, with IMAX's proprietary dual projection system, results in images of unsurpassed quality with approximately 60% more brightness and 40% greater contrast than you'll find anywhere else.

The Most Realistic 3D Experience:

IMAX® 3D delivers 3D images of unsurpassed brightness and clarity by using a set of two projectors that each send a separate image (a left eye and a right eye) simultaneously onto a more reflective screen, providing the most realistic and in-your-face 3D experience available.

The Best Presentation, Every Time:

IMAX's network operations center runs 24x7x365, monitoring every IMAX® theatre around the globe to ensure each system is always running optimally. By collecting and analyzing thousands of points of data real-time, we can detect and correct potential issues before they occur.
